

## **Clinical Radiology – 2-Week Selective Clerkship**

“To teach future clinicians the basics of radiology so that they can better care for their patients.”

Although the majority of our students will not pursue Radiology as a career, virtually all physicians will use radiology in the care of their patients. In this course, our focus is on the radiologic knowledge and skills that all physicians must know. In the morning, students will work through multiple clinical scenarios using lectures (kept to a minimum), small group discussions and case based learning. The goal is to define and clarify the clinical question being asked, to develop the skills of appropriately ordering studies, and to learn to correctly interpret those results in the clinical context. In the afternoon, the student will rotate through the clinical areas with a focus on the patient’s experience of radiology and the radiologist’s role in the performance and interpretation of the studies.

### **Requirements**

Successful completion of the pre-clinical medical school curriculum of the Carver College of Medicine or another LCME accredited medical school.
